

ABSTRACT OF THE DISCLOSURE

A document information management system in which a search-engine-compatible interface unit makes a word in a document displayed on the screen to be specified, transfers the
5 specified word to a search engine as a keyword to be used in the search engine, receives a search result from the search engine, and displays the search result on the screen, while a browser-compatible interface unit performs a search (a keyword search and/or global search) by using the keyword transferred
10 from a browser and transfers a search result to the browser.
